Landmark Papers in Neurosurgery By Reuben Johnson, Alexander Green

Evidence-based medicine is a concept that has come to the fore in the past few years. Clinicians are increasingly encouraged to practise patient management based on available evidence in the scientific literature. For example, new pharmacological therapies are only used when large randomized trials have 'proven' that a particular drug is better than existing ones. This is also the case in surgical specialties, although surgery has traditionally seen a lack of use of this information, with individual surgeon's preferences being most influential in treatment choices. However, more recently, there has been a large expansion of trials and studies aimed at providing surgeons with information to guide their choices using firm evidence.

This book provides a detailed summary of the most important trials and studies in neurosurgery, allowing the reader to rapidly extract key results. Each chapter is written by a prominent international neurosurgeon in that particular field, making this book essential reading for all neurosurgeons and trainees in the field.

Editorial Review

Review

I cant resist stating that this is an excellent book and should be read by every neurosurgeon in training. What I particularly liked is that the authors are not afraid of discussing controversial topics. In addition to the precious information provided here, this book will teach young neurosurgeons in training (and the older fully trained ones as well) how to critically read a paper. *Acta neurochir*
