Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population Biology) By F. John Odling-Smee, Kevin N. Laland, Marcus W. Feldman

The seemingly innocent observation that the activities of organisms bring about changes in environments is so obvious that it seems an unlikely focus for a new line of thinking about evolution. Yet niche construction--as this process of organism-driven environmental modification is known--has hidden complexities. By transforming biotic and abiotic sources of natural selection in external environments, niche construction generates feedback in evolution on a scale hitherto underestimated--and in a manner that transforms the evolutionary dynamic. It also plays a critical role in ecology, supporting ecosystem engineering and influencing the flow of energy and nutrients through ecosystems. Despite this, niche construction has been given short shrift in theoretical biology, in part because it cannot be fully understood within the framework of standard evolutionary theory.

Wedding evolution and ecology, this book extends evolutionary theory by formally including niche construction and ecological inheritance as additional evolutionary processes. The authors support their historic move with empirical data, theoretical population genetics, and conceptual models. They also describe new research methods capable of testing the theory. They demonstrate how their theory can resolve long-standing problems in ecology, particularly by advancing the sorely needed synthesis of ecology and evolution, and how it offers an evolutionary basis for the human sciences.

Already hailed as a pioneering work by some of the world's most influential biologists, this is a rare, potentially field-changing contribution to the biological sciences.

Editorial Review

Review

"In *Niche Construction*, Odling-Smee et al extend the Darwinian approach to provide a systemic framework for thinking about how environments are modified by organisms and the extent to which these constructed environments influence the evolution of other species."--**David Krakauer, *Times Higher Education Supplement***

"*Niche construction* takes off from standard population genetics theory, but reinvents both the niche and evolutionary theory in ways that require a revolutionary re-thinking of ecological and evolutionary dynamics. . . . A brief review cannot do justice to the excitement that [the authors] generate with their ideas. The relatively simple observation that at least some, if not most organisms modify their environment is shown by [them] to have dramatic consequences for our understanding of evolution by natural selection."--**Aaron M. Ellison, *Ecology***

"A marvelous achievement. . . . [The authors] present a sustained, rigorous, and highly original argument for the extended evolutionary theory they advocate, that blends theoretical, empirical and philosophical considerations in a most impressive way."--**Samir Okasha, *Biology and Philosophy***

From the Inside Flap

"We humans are increasingly aware of the way our activities are altering our environment. We rarely reflect, however, that the entire evolutionary history of life on earth is written essentially in terms of organism' modification of their environment, and responses to the subsequent changes. This book is a wonderful exploration of this strangely neglected topic, opening new vistas on how organisms--including humans--construct ecological niches over evolutionary time. After developing a basic theoretical framework, the authors first indicate applications of these new ideas to evolutionary biology, to ecology, and to the human sciences. They even risk some testable predictions. I think this book is a 'must read.'"--Robert M. May, University of Oxford

"There has been a growing understanding in biology that organisms do not simply 'adapt' to preexisting environments, but that they actively change and construct the world in which they live. Not until *Niche Construction*, however, has that understanding been turned into a coherent structure that brings together the observations about natural history and an exact dynamical theory. The sobriquet, 'landmark' is casually used to press the virtues of books, but seldom can it be taken seriously, *Niche Construction* really is a landmark book."--Richard Lewontin, Harvard University

"If the amount of attention warranted by this book is paid to it, the result should be a massive reorientation of evolutionary theory."--David Hull, Northwestern University

"This ambitious book tackles a problem of fundamental importance in science: the whole-hearted synthesis of the disciplines of ecology and evolution. The marriage of these two has often been announced, but the consummation of the union is long overdue."--Robert D. Holt, University of Florida

"Organisms are affected by the world in which they live but also influence that world. Importantly, they may play an active role in constructing the ecological niche into which they fit. This construction process inevitably affects the evolution of their descendants. Odling-Smee, Laland, and Feldman have provided the

first full-length treatment of an intensely absorbing topic which deserves the close attention of anybody interested in evolution."--Patrick Bateson, The Provost's Lodge, King's College, Cambridge

Users Review

From reader reviews:

Louis Venable:

Here thing why this kind of Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population Biology) are different and trusted to be yours. First of all reading through a book is good however it depends in the content from it which is the content is as scrumptious as food or not. Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population Biology) giving you information deeper and in different ways, you can find any guide out there but there is no book that similar with Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population Biology). It gives you thrill examining journey, its open up your eyes about the thing that happened in the world which is maybe can be happened around you. You can easily bring everywhere like in park, café, or even in your technique home by train. In case you are having difficulties in bringing the branded book maybe the form of Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population

Biology) in e-book can be your alternative.

Willie Kelly:

The feeling that you get from Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population Biology) is the more deep you rooting the information that hide inside words the more you get considering reading it. It does not mean that this book is hard to be aware of but Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population Biology) giving you thrill feeling of reading. The article writer conveys their point in a number of way that can be understood through anyone who read that because the author of this publication is well-known enough. This book also makes your personal vocabulary increase well. Making it easy to understand then can go with you, both in printed or e-book style are available. We advise you for having that Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population Biology) instantly.

David Hyman:

The book Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population Biology) has a lot of knowledge on it. So when you make sure to read this book you can get a lot of help. The book was authored by the very famous author. Tom makes some research prior to write this book. This specific book very easy to read you can find the point easily after reading this article book.

Gerard Norman:

E-book is one of source of information. We can add our expertise from it. Not only for students but in addition native or citizen need book to know the change information of year in order to year. As we know those guides have many advantages. Beside we all add our knowledge, may also bring us to around the world. By book Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population Biology) we can consider more advantage. Don't that you be creative people? Being creative person must like to read a book. Merely choose the best book that suited with your aim. Don't possibly be doubt to change your life with this book Niche Construction: The Neglected Process in Evolution (MPB-37) (Monographs in Population Biology). You can more pleasing than now.
